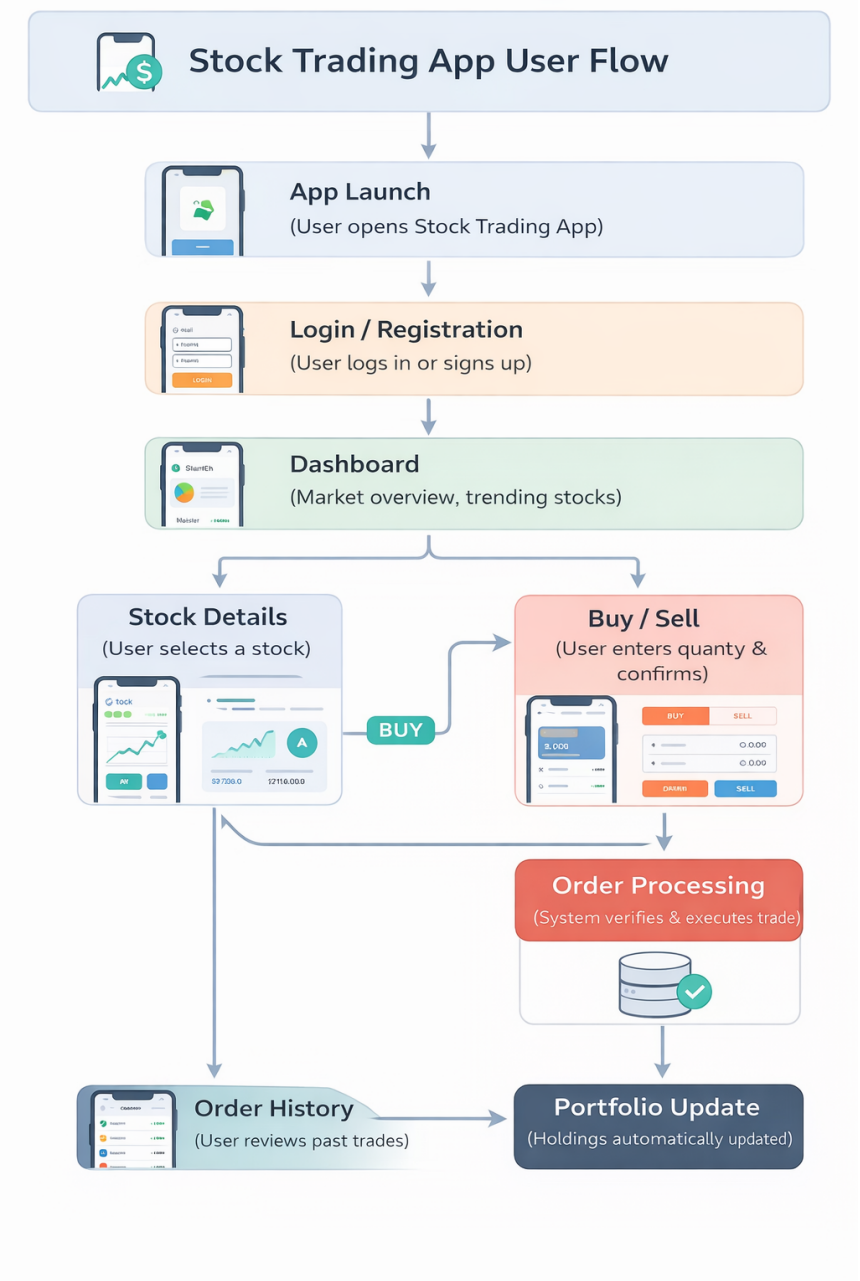
User Flow



User Flow describes the sequence of steps a user follows while interacting with the Stock Trading Application. It helps define how users navigate through the system to perform tasks such as logging in, viewing available stocks, placing buy or sell orders, and managing their investment portfolio. A well-designed user flow ensures that the application remains simple, intuitive, and efficient for users.

The process begins when the user opens the application and logs in or registers a new account. After successful authentication, the user is redirected to the dashboard where important information such as market trends, stock listings, and portfolio details are displayed. From the dashboard, users can browse available stocks and select a specific stock to view detailed information including current price, performance charts, and trading options.

Once the user decides to perform a trade, they enter the number of shares they want to buy or sell and confirm the transaction. The system validates the request by checking wallet balance or available shares and then processes the order. After successful execution, the portfolio is automatically updated and the transaction is recorded in the order history, allowing users to track their investments and trading activities easily.

User Flow Steps

1. Application Launch

The user opens the Stock Trading App on their device.

2. Login / Registration

The user logs in using credentials or creates a new account.

3. Dashboard Access

After login, the user lands on the dashboard where they can see:

- Market overview
- Trending stocks
- Wallet balance

4. Stock Selection

The user selects a stock from the available list to view detailed information.

5. Stock Details Page

The application displays stock price, charts, and buy/sell options.

6. Buy or Sell Action

The user enters the quantity of stocks and confirms the trade.

7. Order Processing

The system verifies balance and executes the trade.

8. Portfolio Update

The purchased stocks are added to the user's portfolio.

9. Order History

Users can review their previous trades and transactions.
